Abstract

This research presents a glossary of cryptocurrency terms extracted from two documents regarding regulation of cryptocurrencies and technology behind it. After giving the theoretical background on terminology and its uses, the paper provides suggested Croatian equivalents for the English terms without the official ones as well as the context for every term extracted. It also analyses the chosen translation procedures and states the difficulties encountered during translation. The results of the research show which translation procedure was most commonly used as well as the strategies used when creating neologisms in both special languages.

Keywords: glossary, cryptocurrency, terminology, translation procedures, neologisms

Sažetak

Ovo istraživanje prikazuje glosar termina iz područja kriptovaluta. Termini su prikupljeni iz dva dokumenta koja se bave regulacijom kriptovaluta i s njima povezane tehnologije. Nakon teorijskog dijela o terminologiji i njezinoj koristi, ponuđeni su hrvatski ekvivalenti za engleske termine koji nemaju službene ekvivalente u hrvatskom jeziku te je naveden i kontekst za svaki odabrani termin. Također su proučeni i prevoditeljski postupci te su navedene uočene poteškoće prilikom prevođenja. Rezultati istraživanja prikazuju učestalost korištenih prevoditeljskih postupaka kao i strategija prilikom tvorbe neologizama u oba nazivlja.

Gljučne riječi: glosar, kriptovaluta, terminologija, prevoditeljski postupci, neologizmi

1. Introduction

With all of the technological advancements happening in the last decade, it is only natural to expect the global financial system to evolve and adapt to the modern times. Taught by the fall of the market in the late 2008, people started to look for alternatives to the traditional banking systems. At that time, the white paper called *Bitcoin: A Peer-to-Peer Electronic Cash System* was published by Satoshi Nakamoto, a pseudonymous author. The white paper explained the functionality of the Bitcoin blockchain network, how new Bitcoin could be created and processes like proof-of-work and proof-of-stake. Bitcoin was the first cryptocurrency created.

A cryptocurrency is a decentralised digital currency which uses encryption to prevent fraudulent activities, secure financial transactions, and create more of the currency. As they are decentralised, cryptocurrencies are not regulated by the government or central banks, meaning that the power over the earned money is entirely in the hands of the person who earned it. That also means they are not backed by the institutions. Being digital means that cryptocurrencies do not have physical form, only virtual and currently their primarily usage is as a medium of exchange.

In its early days cryptocurrencies, being decentralised, fast, low fee and digital, were primarily used as a tool for illicit activities. However, it did not take long for people to recognize their potential outside of the illegal trades. Compared to the current slow and centralised banking system with high fees, cryptocurrencies offered anonymity, fast peer-to-peer payments with low fees and at the same time were cryptographically secured.

Cryptocurrency market soon began to grow while new products revolving around blockchain technology and smart contracts started to appear. The public took an interest in the late 2016 following by mass mainstream media hype. Crypto market entered its bull state which peaked at the beginning of 2018. All that awareness and public exposure of cryptocurrencies forced banks, various financial institutions, and tech giants to look into blockchain technology and try to benefit from it, most notable being IBM, Microsoft, Amazon, Santander, Facebook and others.

As the cryptocurrency market grew, the need for regulations and customer protection became more prominent. Most of the developed countries gave their perspective on the cryptocurrencies and new technology. Governments issued laws regarding crypto space and

tried to handle new market the best way they knew. Some of them (Algeria, Pakistan, Vietnam etc.) decided to ban crypto in its entirety while others (China, Lithuania, Thailand etc.) put restrictions on trading or investing in cryptocurrencies. On the other hand, countries like Luxembourg or Spain see the opportunity in blockchain technology and are trying to create crypto-friendly regulatory space in order to attract new investments.

While issuing notices, warnings and laws, governments had to tackle the issue of new terminology revolving around the fast-growing market and products emerging from it. According to the Law Library of Congress (2018), while the various forms of cryptocurrencies are similar in their nature, decentralisation and technology behind them, the terminology describing them differs between jurisdictions:

Some of the terms used by countries to reference cryptocurrency include: digital currency (Argentina, Thailand, and Australia), virtual commodity (Canada, China, Taiwan), crypto-token (Germany), payment token (Switzerland), cyber currency (Italy and Lebanon), electronic currency (Colombia and Lebanon), and virtual asset (Honduras and Mexico)(The Law Library of Congress, 2018:1).

According to Cabré "...countries that produce science and technology in their own language only compile and standardize their own terminology" (Cabré, 1998:18), but countries whose technological development depends on others (e.g. Croatia) have to create neologisms (mainly through transcription and transliteration, loan translation or calquing). With that in mind, one can conclude that translators are constantly faced with the lack of terminological resources for a particular subject so they have to compile their own glossaries from sources of questionable quality and origin (Rajh & Runjaić, 2018). The aim of this study is to contribute to the translator community as well as the terminology community by creating glossary in the field of cryptocurrencies and providing Croatian equivalents for the terms not yet translated.

2. Theoretical preliminaries

2.1. Terminology and its functions

As the technology and communications developed, the need for specialized communication among communities became evident. Terminology, the discipline concerned with the study and compilation of specialized terms slowly gained on importance (Cabré,

1998:1). According to Cabré (1998), throughout the time, terminology was affected by various social changes. Rapid development of science and technology meant new concepts which required new names. The need for the transfer of information and communication in general created new ways of communication leading to constant updates of the existing vocabularies. Governments had to create official organizations in order to manage the standardization processes. As scientific and technology creation happens in the dominant economic powers, other countries have to borrow technical and scientific vocabulary from them. All of that led to the terminology being one of the most important components of the language standardization (Cabré, 1998:4-5).

The difference between terminology and lexicology, according to Cabré (1998) is "...in the way they conceive and deal with their approach to the object of study, in the object of study itself, in their methodology, in the way terms are presented and in the conditions that must be taken into account when proposing new terms" (Cabré, 1998:8).

When it comes to the methods used in terminology, one can distinguish them from those used in lexicography as the focus moves from concepts to terms. Terminographers try to assign names to concepts while lexicographers "...start with the word and try to characterize it functionally and semantically" (Cabré, 1998:8).

Terminology also helps with optimization of communication between specialists and professionals. It assists them directly or through translators or various bodies interested in the standardization of a language (Cabré, 1998:10). Further to that, one can identify two user groups of terminology: those who use terminology for direct or intermediary communication, and terminologists. With that in mind, terminology can have a communicative dimension and a linguistic dimension. Translators, technical writers, and interpreters are all terminology intermediaries who need terminology to carry out their profession (Cabré, 1998:11-12).

2.1.1. Terminology and translation

As stated by Auger (1988) (qtd. in Cabré, 1998:12), one can differentiate three major orientations in terminology processing when it comes to their main objectives: the linguistic approach (terminology adapted to the linguistic system), the translation approach (terminology for translation), and the aménagiste approach (terminology for planning). For the purpose of this thesis I will focus on the translation approach.

Translation-oriented terminology is greatly developed in countries (or provinces) with two or more official languages, e.g. Canada (Quebec) or Belgium (Walloon), and is also the basis for the terminological projects of multilingual international bodies (e.g. UN, EU etc.). According to Cabré (1998): "This orientation establishes terminological equivalents in the various languages which are used as points of reference by translators and which contribute to the quality of a translated text" (Cabré, 1998:14), meaning that translators can compare previously translated documents and use needed equivalent in their own translations. Terminological reference works mostly present entries in a systematic order, contrary to the general language dictionaries which present entries in an alphabetic order. As Cabré (1998) stated, systematic or concept ordering is an attempt to reproduce the conceptual system of a special subject and that type of ordering allows a better layout for multilingual dictionaries, since in theory the concept is the same for all languages (Cabré, 1998:34). Furthermore, according to H. Hutcheson (1995), majority of the terminology standards published by the International Organization for Standardization (ISO) show their entries in a systematic order because their terminology work is based on the structuring of concepts, meaning that they show relationships among concepts (Hutcheson, 1995:111). With that in mind, the possibility that the translator is going to "...lose his bearings in the immediate conceptual environment of the concept to be translated..."(Picht & Draskau, 1985:132) is much lower.

As stated by Cabré (1998), translation aims to ease the communication between speakers of different languages. It implies translator's understanding of the source text, and that requires knowledge of the specific terms of both, the source and target languages. In what concerns transferring of the information, a good translation should deliver the same message conveyed in the source text, and it should do it in the forms that the native speaker of the target language would use. In order to do that, technical translator must have minimal competence in a specific field to be certain to respect content of both source and target texts.

2.1.2. Terminology and translators

As I have stated in the chapter 2.1., translators and interpreters are terminology intermediaries and as such they depend on bilingual or multilingual vocabularies to carry out their work. Under certain circumstances, they have to prepare terminology themselves if some of the terms are not listed in the vocabularies or databanks. Furthermore, the time constraints mostly do not allow them to wait for the terminologist to find the needed equivalent.

The context in which the term is used is a great help to the translator as it usually contains the information on how to use the term and may provide information about the concept so the translator knows the precise form to refer to a specific content (Cabré, 1998:48).

Cabré (1998) also stated that the key to multilingual terminology is terminological equivalence. "The authors of bilingual or multilingual technical dictionaries often start from the principle that terminologies reflect objective structures of the real world" (Cabré, 1998:48), because the structure of a special language in the fields such as arts and social sciences, which are not highly structured, may not be the same in other languages.

2.2. Translation methods and procedures according to Jean-Paul Vinay and Jean Darbelnet

Roman Jakobson (qtd. in Venuti, 2000:69) depicts translation (on the level of interlingual translation) as a process of recoding where the translator recodes the message received from another source and then transmits it. Therefore, translation "...involves two equivalent messages in two different codes." L. Venuti (2000:69), on the other hand, does not agree and points out the Jakobson's understatement of the interpretive nature of translation as he finds recoding to be an active rewording not simply transmitting the foreign message, but transforming it.

According to Jean-Paul Vinay and Jean Darbelnet (qtd. in Venuti, 2000:84), we can summarise countless of different translation methods or procedures into just seven which can, in practice, be used on their own or in combination with each other. It is also stated that translators can choose from two different methods of translating, one being direct (literal) translation, and the other one being oblique translation.

Direct translation is used in those translation tasks where it is possible to transpose the source language (SL) message element by element into the target language (TL). However, there are also certain stylistic effects which cannot be transposed into the TL without changing the lexis or the syntactic order. In those cases, one has to use more complex translation procedures which are called oblique translation methods as J.P. Vinay and J. Darbelnet claim (qtd. in Venuti, 2000:84).

According to Vinay and Darbelnet (2000:85-93), the first three procedures are direct and the other four are oblique.

Procedure 1: Borrowing - used to overcome lacuna, it is one of the simplest of all translation methods (e.g. using foreign terms as "roubles" or "tequila" in order to introduce the flavour of the SL).

Procedure 2: Calque - a special kind of borrowing where a language borrows an expression form of another, but translates literally each of its elements (e.g. English word "honeymoon" into Croatian "medeni mjesec"¹).

Procedure 3: Literal translation - a word for word translation, it is the direct transfer of a SL text into a grammatically and idiomatically appropriate TL text (e.g. English word "beer" into Croatian "pivo"¹).

"If, after trying the first three procedures, translators regard a literal translation unacceptable, they must turn to the methods of oblique translation." (qtd. in Vinay, 2000:87).

Procedure 4: Transposition - it involves replacing one word class with another without changing the meaning of the message (e.g. English word "From" meaning "sender" translated into Croatian as "Pošiljatelj"¹).

Procedure 5: Modulation - a variation of the form of the message, obtained by a change in the point of view (e.g. translation of French "Peu profond"² into English as "shallow").

Procedure 6: Equivalence - the same situation is described by two texts using completely different stylistic and structural methods (e.g. English cry transcribed as "Ouch!" in Croatian would be interpreted as "Joj!" or "Au!"¹).

Procedure 7: Adaptation - the type of situation being referred to by the SL message is unknown in the TL culture so the translator has to create a new situation that can be considered as being equivalent (e.g. in a context of a popular sport which is specific for a certain countries, "baseball" (US) would be adapted into Croatian as "rukomet"¹).

However, there is a noticeable difference when it comes to the translation of general texts and specialized texts. According to Cabré (1998), the use of standardized terminology makes communication between specialists more efficient, but the criteria used to evaluate specialized texts differs from that to evaluate general texts. "In general texts, expression,

¹ Example is provided by the author.

² In French „peu“ means „little“ or „not very much“, while „profond“ means „depp“.

variety and originality prevail over other features; in specialized texts, concision, precision and suitability are the relevant criteria" (Cabré, 1998:47). Cabré (1998) further claims that the concision reduces the chance of misinformation, precision is important because of the functional relations among specialists, and it has to be suitable to the communicative situation in which it is produced. All of that, according to Thelen (2015), means "...that the professional specialist (non-literary) translator has less translation freedom when encountering a term than when dealing with a general language word" (Thelen, 2015:352).

Cabré (1998) also stated that the main purpose of special languages is to allow objective, precise, and unambiguous exchange of information particularly between subject field experts and professionals (Cabré, 1998:77), which would also mean that translators are trying to achieve monosemy (one-meaning) within a given field. An example of special language term translation are terms "virtual wallet" (virtualni novčanik) and "smart contracts" (pametni ugovori). Both of those terms have only one meaning and it is related to the cryptocurrency field. Their Croatian translations share that characteristic as we cannot misinterpret them when out of context, so one can say they are precise and unambiguous.

3. Research

Before conducting the research, I expected to collect around 50 terms relevant to crypto space, from which I assumed half would be economic and legal terms. Considering that the Croatian language belongs to the group of non-dominant languages which, according to Cabré, create terms based on neology (Cabré, 1998:18), it is normal to expect that translators sometimes (49.5%) or even often (18.2%)³ have to create neologisms (Rajh & Runjaić, 2018:235). I have also assumed that around one third of the extracted terms in English would not have equivalents in Croatian due to the novelty of cryptocurrency space and appearing products. Regarding the procedures used when translating those terms, I expected the most common one to be calquing, followed by borrowing. Reasoning behind that was the previous experience dealing with new terminology of special languages and the way new words come into a non-dominant language, especially terminology used in the IT field.

³ The survey was conducted among 99 translators and has collected answers to 37 questions. The respondents were mainly freelancers (59.6%), followed by those employed in companies (27.3%), and the rest were part-time translators (Rajh & Runjaić, 2018:235).

3.1. Motivation for the research

In a paper *Crowdsourcing terminology: harnessing the potential of translator's glossaries*, I. Rajh and S. Runjaić explained the need for collaboration between members of the Translators and Interpreters Interest Group (TIIG) and terminologists from the Department of General Linguistics at the Institute of Croatian Language and Linguistics. Mainly, they wanted to show "...the current situation and methods of gathering material for the terminological database of translators' glossaries and, finally, how that database is linked in a specific format to the metasearch engine within the Croatian Terminology Portal" (Rajh & Runjaić, 2018:234).

In order to assess the situation, working group has conducted a survey among the members of TIIG at the beginning of 2016. The results were rather interesting as they showed that "...as many as 72% of translators find inconsistent, inappropriate or outdated solutions in terminological resources they use" (Rajh & Runjaić, 2018:235). Furthermore, the results showed that a large number of respondents were not familiar with the most significant online terminological resources when it came to Croatian, the Croatian Terminology Portal and IATE: "...as many as 42% of translators are not aware of their existence, and roughly 70% of those who are informed consider that those resources do not satisfy the needs of translators." (Rajh & Runjaić, 2018:235). Those who do use the Croatian Terminology Portal stated that it was reliable, but was lacking when it came to the number of terms and colloquialisms. Also, the context, which is especially useful to the translators, is not provided. IATE is great when dealing with EU terminology, but it has a limited number of Croatian terms, which also tend to be wrong (Rajh & Runjaić, 2018:235).

Around that time, a survey regarding needs and habits of the users of Struna and the Croatian Terminology Portal was carried out. The results showed that among the 85 respondents, 63.4% used electronic dictionaries and terminological databases daily, while 20.2% use printed terminological resources (Rajh & Runjaić, 2018:236). Regarding frequency of visits, Struna was searched several times a month (71.8%) and 7.1% daily, as opposed to the Croatian Terminology Portal which only 46.3% of respondents were searching several times a month (Rajh & Runjaić, 2018:236).

The overall conclusion was that Croatian translators were not satisfied with the then current terminological resources for the Croatian language and that many of the translators were not aware of the existence of different terminological resources. The suggestion was to

create a database of translator's glossaries which would greatly help them in translation while at the same time improving the number of visits to the Portal. Following its creation, it provided an additional benefit for a wider translator community as the Croatian Terminology Portal included translators' glossaries and the database was fully operational and open to public (Rajh & Runjaić, 2018:238).

After reading the results of a survey (Rajh & Runjaić, 2018) and learning of the current situation regarding the needs of the translator's and terminology's communities, I have concluded that the glossary of the cryptocurrency terms would be helpful to both of the communities. As the crypto market is still new and not well regulated at the moment, the need for cryptocurrency glossary can only be greater once Croatia or the EU decide to seriously regulate the market.

Further to the above mentioned, the aim of this research is to collect and sort the cryptocurrency terminology related to the existing regulations, government issued laws and policies as well as to provide Croatian equivalents for those terms without the official one.

3.2. Methodology

The corpus for the research is extracted from 2 documents regarding cryptocurrency regulation and blockchain technology. The first one is *Regulation of Cryptocurrency Around the World* (The Law Library of Congress, 2018) which is a report surveying 130 countries around the world, their standpoints towards cryptocurrency and issued laws or policies on the matter. The second document is *Bitcoin: A Peer-to-Peer Electronic Cash System* (Nakamoto, 2008) which explains the blockchain technology behind the Bitcoin cryptocurrency and its use case. The reason for choosing those two documents is their relevance in crypto space as well as their comprehensive nature on the matter. Furthermore, I chose only Bitcoin's white paper as it is the first and the most known cryptocurrency today.

After collecting the corpus I decided to sort it into 2 major groups. One with terms closely associated with cryptocurrency and the blockchain technology, and the other one containing economic and legal terminology commonly used in crypto space. The former group is further divided into two tables. The first one consists of terms in English with their Croatian equivalents confirmed by EU's official documents and also providing context in both languages. I used EUR-lex as the main source of EU's documents as it provides official translations into Croatian. To keep the tables clear and simple, CELEX number of the referenced document is provided instead of the full URL, which is given in the Bibliography

part of this thesis. EU's documents released post-2012 were primarily used. From that year onwards began the regulation of the crypto space and Bitcoin had its first noticeable rise. In the second table I initially expected to group up English terms whose Croatian counterparts were incorrect or incomplete. Later I found out that there were no such terms among the extracted cryptocurrency terminology, as they were either translated and used in the official documents or there is no translation into the Croatian language at all. For that reason I omitted the above mentioned group and proceeded with the last table which consists of English terms without the official Croatian translation. Every term is defined and the context is provided in order to further clarify the meaning. For that group of terms I gave possible Croatian equivalents in accordance with seven methods provided by J.P Vinay and Jean Darbelnet (qtd. in Venuti 2004:84-93). Furthermore, I have opted for alphabetical ordering, despite the fact that the terms presented in terminological works are usually given in systematic order, as the alphabetical order is the common practice in creating translator's glossaries. Lastly, I presented the reasoning behind chosen translation methods and provided translations.

3.3. Results

Upon completion, the glossary had 61 English terms with their Croatian equivalents provided. In the first, out of two major groups, were 38 terms; those were closely associated with cryptocurrency and blockchain technology. Out of those, 18 had official translation and were already used in the EU's official documents, and 20 did not have the official Croatian equivalents. The remaining 23 terms were economic and legal terms related to the cryptocurrency market and they compose the second major group. Each of those terms were previously used in the EU's official documents and their Croatian equivalents were provided. I will further elaborate on *Table 2* and discuss *Table 1* and *Table 3* in chapter 4 of this thesis.

3.4. English terms closely associated with cryptocurrency and blockchain technology

3.4.1. Cryptocurrency terminology used in the official documents

English term	Context in English	Context in Croatian	Croatian equivalent
blockchain technology	“In particular, Artificial Intelligence (AI) and blockchain technology could have a positive	“Posebno bi umjetna inteligencija i tehnologija lanca blokova mogle imati pozitivan	tehnologija lanca blokova CELEX:52019XG0313(01)

	impact on e-Justice, for example by increasing efficiency and trust.”	učinak na e-pravosuđe, na primjer povećavajući učinkovitost i povjerenje.”	
crypto-assets	“In the area of crypto-assets, it has been noted that technology-based innovations can avoid coming within the scope of regulation, even though they are in fact operating in a highly regulated market.”	“U području kriptovalutina zapaženo je da se, iako se poslovanje kriptovalutama odvija na tržištu koje je u velikoj mjeri regulirano, tehnološke inovacije ipak mogu neopaženo provući kroz rupe koje u tim propisima postoje.”	kriptoimovina CELEX:52018AE1056
cryptocurrency	“In addition, particular attention needs to be given to following the development of cryptocurrency markets (bitcoin and others).”	“Usto, posebna se pozornost treba pridati praćenju razvoja tržišta kriptovaluta (bitcoin i ostale).”	kriptovaluta CELEX:52016IE5526

Table 1 Cryptocurrency terminology used in the official documents

Table 1 above lists the extracted cryptocurrency terms which were used in the official EU’s documents. In columns two and three I have provided English context for each of the terms and Croatian translation of that context. As I have mentioned in chapter 3.2., the CELEX number is provided instead of a full URL in order to keep the table clear.

3.4.2. English terms without official Croatian translation

English term	Definition	Context in English	Suggested Croatian equivalent
(crypto-currency) exchange ⁴	“A cryptocurrency exchange is any system that operates on the basis of trading cryptocurrencies with other assets.” www.techopedia.com	“You may also buy and sell digital currency on open exchanges, called digital currency or cryptocurrency exchanges.” www.bankofcanada.ca	mjenjačnica (kriptovaluta)
(crypto-currency) miners ⁴	Computers which solve computational math problems making payment network trustworthy and secure by recording transactions and checking their accuracy.*	“The miners typically operate in large decentralised networks, can be energy-intensive 134 and associated with slower transaction speeds.” CELEX:52019SC0106	rudari (kriptovaluta)
(crypto-currency) mining ⁴	A process of solving complex computational math problems and verifying transactions on a	“In particular, problems could be expected with energy consumption and	rudarenje (kriptovaluta)

⁴ In a crypto space, the terms are most of the time used as „exchanges”, „miners“ and „mining“. The reader is expected to know that it denotes cryptocurrency exchanges, miners and mining.

	blockchain network, in order to gain cryptocurrency token of that network.*	transaction times for blockchains secured by a 'proof-of-work' algorithm, which is the principle behind the energy-intensive 'mining' of cryptocurrencies...” CELEX:52019SC0106	
blockchain node	Blockchain nodes store, exchange and preserve blocks of data. They are mostly computers or bigger servers which are interconnected and are forming the infrastructure of a blockchain.*	“Therefore, blockchain nodes are responsible for acting as a communication point that may perform different functions.” www.binance.vision.com	čvorište lanca blokova
convertible virtual currency	It is an unregulated digital currency which can be exchanged for legal tender.*	“Convertible virtual currency, which includes crypto-currency, can be converted into a fiat currency, either directly, or through an exchange.” www.iomfsa.im	konvertibilna virtualna valuta
crypto token	“Crypto tokens represent a particular fungible and tradable asset or a utility that is often found on a blockchain.” www.investopedia.com	“There can be another crypto token that gives entitlement to the token holder to view 10 hours of streaming content on a video-sharing blockchain.” www.investopedia.com	kriptotoken
digital collector coin	A coin which will have digital (token) as well as physical version. “Collectors will be able to purchase tokens, exchange them and, having collected the needed set, redeem the physical coin.” www.lb.lt	“The issuance of the digital collector coin will be yet another step towards implementing one of the Bank of Lithuania’s strategic directions in the field of innovation and fintech.” www.lb.lt	digitalna numizmatička kovanica
Foreign Virtual Currency Exchange Service Provider	A person carrying out a Virtual Currency Exchange Service in a foreign state.*	“The term "Foreign Virtual Currency Exchange Service Provider" as used in this Act means a person who carries out a Virtual Currency Exchange Service in the course of trade in a foreign state under the same kind of registration as the one referred to in Article 63-	Strani pružatelj usluge zamjene virtualnih valuta

* Definitions of English terms provided by the author

		2...” www.japaneselawtranslation.go.jp	
inherent encryption	A feature of certain devices or products which have built-in encryption and do not need to be protected via external software applications.*	“While the various forms of what are broadly known as “cryptocurrencies” are similar in that they are primarily based on the same type of decentralized technology known as blockchain with inherent encryption, the terminology used to describe them varies greatly from one jurisdiction to another.” www.loc.gov	ugrađena kriptografska zaštita
initial token offerings	A process of digitizing or tokenizing of an asset and making it publicly available through the internet.*	“The Canadian Securities Administrators (CSA) today published CSA Staff Notice 46-307 Cryptocurrency Offerings, which outlines how securities law requirements may apply to initial coin offerings (ICOs), initial token offerings (ITOs), cryptocurrency investment funds and the cryptocurrency exchanges trading these products.” www.securities-administrators.ca	inicijalna javna ponuda kriptotokena
multi-signature wallets	The funds stored on multi-signature wallets can only be moved from the wallet if multiple signatures are provided (through the usage of different private keys).*	“There are 2 types of wallets providers: ·software wallets providers and ·custodial wallets providers (including multi-signature wallets).” CELEX:52017SC0241	višestruko zaključani novčanici
payment token	“Payment tokens represent the purest form of cryptocurrencies, serving as mediums of inherent value similar to established fiat currencies. They aren’t considered securities but they are means of payment.” www.medium.com	“Usually, payment tokens — otherwise referred to as simply “cryptocurrencies” — have no further function or link to other development projects.” www.medium.com	platni token
proof-of-stake	“Proof of Stake (PoS) concept states that a person can mine	“The main advantages of the Proof of Stake algorithm are	sustav dokaza udjelom

	or validate block transactions according to how many coins he or she holds.” www.investopedia.com	energy efficiency and security.” www.binance.vision	
proof-of-work	“...a system that requires a not-insignificant but feasible amount of effort in order to deter frivolous or malicious uses of computing power...” www.investopedia.com	“Proof of work makes it extremely difficult to alter any aspect of the blockchain, since such an alteration would require re-mining all subsequent blocks.” www.investopedia.com	sustav dokaza radom
simplified payment verification (SPV)	“A method for verifying if particular transactions are included in a block without downloading the entire block.” www.bitcoin.org	“SPV is a good way to validate Bitcoin transactions even on devices like phones where you usually don’t want to store the complete Blockchain copy of currently 173 Gigabytes.” www.medium.com	pojednostavlje na provjera plaćanja
token crowdsale	“A type of crowdfunding that issues tokens (electronic records) that are stored on the user's device.” www.encyclopedia2.thefreedictionary.com	“Crowdsales are a great tool for investors and traders to speculate on promising projects while providing them with the necessary funds.” www.cointelegraph.com	prodaja tokena množtvu
token pre-sale	A token sale event preceding official crowdsale or initial coin offering (ICO) run by various blockchain enterprises.*	“Securities Commission Malaysia (SC) would like to caution investors as we note the emergence of digital token based fundraising activities / investment schemes in Malaysia and elsewhere, which may be referred to as “initial coin offerings”, “initial token offerings”, “token pre-sale”...” www.perma.cc	preprodaja tokena
utility token	“a digital token of cryptocurrency that is issued in order to fund development of the cryptocurrency and that can be later used to purchase a good or service offered by the issuer of the cryptocurrency” www.merriam-webster.com	“However, if the token doesn’t qualify according to the Howey test, then it classifies as utility tokens.” www.blockgeeks.com	token za kupovinu
virtual asset	“A virtual asset is a digital representation of value that	“This way, the proposal can move forward without using	virtualna imovina

	can be digitally traded, or transferred, and can be used for payment or investment purposes.” www.fatf-gafi.org	the terms “virtual currency” or “cryptocurrency,” and the term “virtual assets” becomes fully interpretive.” www.medium.com	digitalna imovina
virtual commodity	A virtual product which can be bought, sold or traded. *	“...bitcoin is a type of virtual commodity that is neither legal tender nor a financial instrument subject to the supervision of the AMCM....” www.gcs.gov.mo	virtualna roba virtualni proizvod

Table 2 English terms without official Croatian translation

In this chapter I will present the terms for which there are no official Croatian equivalents and provide reasoning for the suggested translations. Starting alphabetically, terms "(cryptocurrency) exchange", "(cryptocurrency) miners", and "(cryptocurrency) mining" were rather simple to define and translate. In these cases I decided to use calquing. As the terms "exchange", "miners" and "mining" already exist and they keep their meaning (although broader) in the context of cryptocurrencies, just adding the word "cryptocurrency" in order to closely define them was enough. The suggested Croatian equivalents are "mjenjačnica (kriptovaluta)", "rudari (kriptovaluta)" and "rudarenje (kriptovaluta)" (in that order). Another option was to translate them as "kripto mjenjačnica", "kripto rudari", and "kripto rudarenje". In my opinion, that would create discrepancy with the terms such as "crypto-asset" and "cryptocurrency" which are officially translated as "kriptoimovina" and "kriptovaluta", meaning that in the case of the suggested equivalents the emphasis is on what is being exchanged or mined, while with the second option one could mistaken the word "kripto" as something describing the process behind the words following it.

The following terms were "blockchain node" and "convertible virtual currency" with calquing as the method of choice. We already have official translations of terms "blockchain" (lanac blokova) and "virtual currency" (virtualna valuta) so I had no doubt how to translate the new terms. The suggested Croatian translations are "čvorište lanca blokova" and "konvertibilna virtualna valuta". The word "node" translates into Croatian as "čvor" or "čvorište" and it perfectly depicts the purpose of the blockchain nodes, being interconnected communication points. The word "convertible" in source language further defines some of the virtual currencies (and points out that characteristic of them), as does the word "konvertibilna" in target language.

Calquing was used as the method of translation of term "crypto token" as well. Led by the previously mentioned examples "crypto-asset" and "cryptocurrency", the suggested translation is "kriptotoken".

The terms "digital collector coin" and "Foreign Virtual Currency Exchange Service Provider" were a bit challenging to translate just for the fact that the relations between the words composing the terms were a little confusing when translated into Croatian. The suggested Croatian equivalents are "digitalna numizmatička kovanica" for "digital collector coin" and "Strani pružatelj usluge zamjene virtualnih valuta" for the term "Foreign Virtual Currency Exchange Service Provider". As the word "collector coin" translates into Croatian as "numizmatička kovanica", the word digital (digitalna) denotes the characteristic of a collector coin in both SL and TL. The translation method used was calquing. For the term "Foreign Virtual Currency Exchange Service Provider" I had to change the word order when translating into Croatian. With that in mind, the chosen procedure is modulation, as one can notice a variation of the form of the message.

For the term "inherent encryption" I used calquing. The suggested Croatian equivalent is "ugrađena kriptografska zaštita" which is pretty self-explanatory. The word "inherent" denotes something existing as a basic part of something else. In the context of crypto technology I find the Croatian word "ugrađen" the most suitable one.

Another example of calquing is the translation of the term "initial token offerings" as "inicijalna javna ponuda kriptotokena". As we already have official translation of the term "initial coin offerings" (inicijalna javna ponuda kriptovaluta), I decided to use that form for the consistency in translation. In this context the word "token" is translated as "kriptotoken" for the reason of being less ambiguous than just "token".

The term "multi-signature wallets" was challenging to translate as I did not want to use variations of the Croatian word "potpis". The reasoning behind that was that I did not find the terms "višestruko potpisani novčanici" or "novčanici s više potpisa" explanatory enough. The reader would have to know what "signature" (potpis) denotes in the context of a crypto space. As the term "multi-signature" specifies that one has to use more than two private keys in order to move the funds stored on the wallet, we can state that that kind of wallet just have more "locks". From that point of view it became a bit easier to translate it. Further to the above, I chose modulation as a method, changed the point of view and suggested "višestruko zaključani novčanici" for the Croatian equivalent.

Translation of the term "payment token" was rather simple as I used calquing and suggested "platni token" for the Croatian equivalent. The meaning of the term "platni token" is clear, denoting it being used as a means of payment. For the terms "proof-of-work" and "proof-of-stake" the chosen method of translation was modulation. With the suggested Croatian equivalents "sustav dokaza radom" and "sustav dokaza udjelom", one can notice variation in the form of a message. I also added word "sustav" as it better describes the concept of each term. Furthermore, other possibilities were "dokaz rada" and "dokaz udjela" according to the translation of the term "proof-of-concept" (dokaz koncepta), which I personally find not specific enough.

"Simplified payment verification" is a method of verifying a certain transaction without downloading the entire block. For translation of that term I used calquing and suggested "pojednostavljena provjera plaćanja". In the SL, word "simplified" further defines the process of payment verification, as does the word "pojednostavljen" in the TL. Payment verification is a well known process in today's society so I found the translation "provjera plaćanja" a suitable one.

The term "token crowdsale" was a challenge to translate only because of the relations in the concept, as who sells what and to whom. One can say that crowdselling is a type of crowdfunding, but when translating crowdfunding (skupno financiranje) it is a self-explanatory term. If we translate crowdselling literally as "skupna prodaja" or "grupna prodaja" the process that that term denotes is simply wrong. In crowdsales, one entity sells the product to the "crowd"; while in Croatian "skupna/grupna prodaja" could imply that more entities are together selling product(s) to everybody else. For that reason I suggested the term "prodaja tokena mnoštvu" as the Croatian equivalent and the method of choice was modulation. That way it is clear whom the tokens are issued to.

The term "token pre-sale" was translated using calquing procedure while I used modulation to translate the term "utility token". The suggested Croatian equivalents are "pretprodaja tokena" and "token za kupovinu". The word "pre-sale" is usually translated into Croatian as "pretprodaja", and in the context of cryptocurrencies it keeps its meaning. When translating the term "utility token" the form of the message had to be slightly changed, but it kept its meaning that it can be used to purchase a product or service.

The last two terms are "virtual asset" and "virtual commodity". The method of choice was again calquing. In both cases I suggested two Croatian equivalents which I find equally

acceptable and which I would use depending on the context. For "virtual asset" I suggested "virtualna imovina" and "digitalna imovina" while for the term "virtual commodity" the suggested Croatian translation was "virtualna roba" and "virtualni proizvod". In the context of cryptocurrencies, the difference between "virtualan" and "digitalni" is negligible. According to the site *Hrvatski jezični portal*, "virtualan" denotes something created using a computer, apparent, artificial, and used on the internet. The word "digitalni" denotes something which is recorded in a binary form (0 or 1). Regarding cryptocurrencies one can state that both are true. The case of translating "commodity" as "roba" or "proizvod" is similar to the previously mentioned example. Both "roba" and "proizvod" are defined as a result of human labour intended for sale on the market. With that in mind, I would state that the usage of both "roba" and "proizvod" depend on the translator and his/her preferences.

Further to the above, I suggested 20 Croatian equivalents for the terms missing them, along with the definitions of those terms without a suitable one. Regarding the translation procedures used when translating the terms, I used calquing 14 times and modulation 6 times. In this research other translation techniques were not used. With that in mind, one can conclude I was prone to using calquing most of the time, which I expected before conducting a research.

3.5. Economic and legal terms related to cryptocurrency market

English term	Context in English	Context in Croatian	Croatian equivalent

Table 3 English terms without official Croatian translation

4. Discussion

In the chapter 3 of this thesis I stated, before conducting the research, that the expected number of the extracted terms would be around 50. Now, I can conclude that I was slightly off regarding the quantity of terms and the size of glossary, as there are 61 extracted terms. Also, legal and economic terms presented in *Table 3* constituted 37.7% of the glossary, contrary to my assumption that that number would be closer to the 50%. On the other hand, my expectation that one third of the extracted terms in English would not have Croatian equivalents was very precise, percentage being 32.7%. Regarding the procedures used, calquing was by far the most common one, as I expected, but the second most used procedure

was modulation, contrary to the assumed borrowing. The reason for that I find in the fact that if there was a chance to use one of the direct methods (literal translation) I would use calquing. If translation using calquing as a procedure was unacceptable, I would immediately turn to the methods of oblique translation, as I see them being more flexible than procedures of direct translation.

As stated in the introduction to this thesis, countries with non-dominant languages and technologically dependence on others usually create terms based on neology. So according to Cabré (1998:204), neology is necessary in special subject fields in which the emergence of new concepts requires constant neological activity. There are also two types of situation she finds to require specific intervention. First, when two or more designations converge in a concept with a negative impact on communication; and second, when a special language does not have the designation required for expressing a concept. The latter case was the usual one while compiling the glossary.

Furthermore, when dealing with the lack of designation for a certain concept in a special language, English neologists tend to create neologisms in a various ways. Taking a researched corpus as a reference (primarily terms presented in *Table 1*) I found combining the existing words to create a new term to be the most popular one, e.g. terms “utility token” and “electronic money”, as well as “blockchain” and “cryptocurrency” being created by compounding.

Another process I noticed was creating neologisms through semantic extension. That means that an existing word gets a new meaning or that its meaning has been altered, e.g. terms "mining" and "miners" already exist, but in a new context of crypto space they acquire new meaning and denote a new concept. Prefixation is also one of the ways to create a neologism, e.g. terms “token pre-sale” and “multi-signature wallets” where prefixes “pre-“ and “multi-“ were added to form a new word.

When it comes to the Croatian official documents, most of the new terms are made by calquing. For example, the terms “smart contracts” and “digital currency” are translated as “pametni ugovori” and “digitalna valuta”. Regarding special language, Croatian language, being non-dominant, tends to borrow words from another language and translate it word-for-word in order to expand its own lexis.

5. Conclusion

In this paper I have compiled, analysed and presented a glossary of the cryptocurrency terms in order to contribute to the translators' and terminologists' communities. The rationale for the research is the lack of solutions in terminological resources regarding cryptocurrency field, as it is still new and not well regulated. The thesis is presented from the translator's point of view as it puts emphasis on the importance of a translator's glossary to the terminology resources. Before conducting a research, I have stated the theoretical background on terminology and its uses in modern society, as well as its relation to the translation and translators' community. Regarding the main objectives of the three major orientations in terminology processing, the focus was again on the translation approach (terminology for translation). Furthermore, the paper lists the translation methods and procedures according to J.P. Vinay and J. Darbelnet which were later used in the research. Every method was briefly explained and an example for each was given.

Authors initial expectation was that the most common procedure would be calquing followed by borrowing, and that the whole glossary would consist of around 50 terms. Out of those terms we assumed that half would be legal and economic terms, as those fields are interconnected with crypto space.

The research corpus was extracted from two relevant documents named *Regulation of Cryptocurrency Around the World* (The Law Library of Congress, 2018) and *Bitcoin: A Peer-to-Peer Electronic Cash System* (Nakamoto, 2008). The compiled glossary contained 61 terms out of which 38 were closely associated with crypto space, while 23 terms were economic and legal terms related to the cryptocurrency market. The main source of the EU's documents was EUR-lex as it provided official translations into Croatian. The glossary contained 20 terms without the official translation or usage in the EU's documents. For those terms the Croatian equivalents have been suggested in accordance with seven translation procedures mentioned earlier in the study. Furthermore, the definitions of terms were provided along with the context and usage in a sentence.

Afterwards, I analysed every suggested Croatian equivalent and gave explanation on the procedure used. I have also stated challenges encountered while translating and solutions chosen in order to overcome those difficulties. The results of the research showed that the main procedure was calquing, as I expected, but also that the number of terms extracted was

bigger than assumed. Adding to that, the number of economic and legal terms was not as high as previously thought; it constituted 37.7% of the glossary.

In the end, I have addressed the strategies regarding the creation of neologisms in order to fill a lacuna in a special subject field, in this case that being cryptocurrency field. By analysing the extracted corpus, I noticed that the neologists in English usually create new terms by combining the existing words. Cases of creating neologisms through semantic extension and prefixation were also recorded. The Croatian language however, regarding the crypto space and the extracted terms for this glossary, introduces new terms mainly through calquing.

Although the number of the terms constituting the glossary is relatively small, it is rather detailed and offers a solid starting point for the future studies on the cryptocurrency terminology.
